

Structural Light-Steel Framing Solutions

ONTARIO LEADS THE WORLD TOWARDS SETTING A GLOBAL STANDARD FOR STRUCTURAL LSF CONSTRUCTION!

Genesis has continued to prove great success in converting thousands of 'wood framed', 'heavy-steel framed' and 'masonry block' buildings, into more efficient, fully-integrated 'light-steel framed' structures. By working closely with leading Ontario Builders, Contractors, Architects and Structural Engineers, Genesis has made significant progress in introducing innovative framing solutions and services, that are not only reducing building costs and accelerating construction schedules, but are addressing growing issues faced by the building construction industry. Issues such as; rising builder's risk insurance premiums, skilled construction labour shortages, rising energy costs, rising standards for improved indoor-air quality, depleting natural resources and builder's environmental responsibility.

Although Genesis Technology was introduced as a superior residential framing solution, it has evolved into a significant competitor within the Commercial building market as well. Today you will find Hotels, Long Term Care Facilities, Apartments, Condominiums, Restaurants and Recreation Centres, being constructed with Light-Steel Building Systems by Genesis .

2004 will mark a major turning point in the evolution of Genesis Light-Steel Building Technology and Design Software Development. Several U.S. companies have recognized the need for this proven framing alternative, and through exclusive licensing arrangements, are now offering Genesis LSF building solutions to their own local building markets. Our progress and success in Ontario, has not only attracted the attention of the U.S.A., but has also captured the interest of many other countries throughout the world.

As Canadians, we are certainly proud to be recognized as global leaders in building technology, and we look forward to contributing further to this leadership, by continually developing the finest and most sought after building technologies in the world.
